

## *Ambitious and growing ports face huge competition to attract and retain shipping line business*

### **Automated real-time charging for all cargoes**

You have to be faster and smarter at what you do, and track costs at every stage of the process to ensure that every transaction is recorded and billed accordingly.

Today's ports are multi-terminal and multi-site and often deal with complex charging issues, such as currencies, formats and frequency of invoicing. Customers need to be billed correctly and on time. You need to know the true costs associated with moving freight.

In Master Terminal™ this functionality starts right at the gate of your terminal. It captures every transaction, allowing you to account and pass on the correct charges accordingly. This includes all Harbor Management-based accounting as well as terminal and storage costs. Keeping track of costs is only one part of running a successful terminal, but get it wrong and the consequences can be severe.

### **Master Terminal's cash handling module features:**

- Automated real-time charging for all cargoes
- Automated charging for Harbor Management
- Fully configurable
- Interfaces to other systems
- Full track and trace
- Customizable outputs (full or transactional invoicing)
- Cash handling functionality

### Automated charging for Harbor Management

Harbor Management invoicing is based on vessels and voyages. Harbor services such as tugs, pilots, gangs and berthage are handled, as well as resources including consumables like telephone and rubbish collection, and operational resources like equipment usage. The invoice lines produced can be added to the ship side cargo invoice or invoiced separately.

### Fully configurable

Master Terminal supports multiple levels of storage processing, from terminal area to the number of items on site, through to elapsed time evaluation and includes automated cargo owner change control.

When a storage charge is raised, the cargo's current location can be selected and the associated costs applied to the invoice.

### Interfaces to other systems

Master Terminal's automated, real-time invoicing module handles all invoicing requirements including special rates, price adjustments, and taxes. Invoices can be produced either in their entirety or at a transactional level, and emailed or printed. The invoicing module also interfaces to most standard invoicing systems.

### Cash handling functionality

The cash handling module gives you the flexibility to receive payment by cash (including check, EFTPOS, credit card, etc) at any stage of the process. Debtors can be set up in the system as credit or cash payers. Information like the name of the payee and the amount paid can be recorded and used for future transactions and for reporting.

The system is fully configurable, and all your transactions are easily searchable. You can set alerts to allow for the release or hold of cargoes depending on the status of payment. The system also allows for payments to be made in two different currencies.
